The elementary particles of electricity, the electron and the proton, are opposites electrically. Electricity of which the elementary unit is the electron is called **negative electricity**; electricity of which the elementary unit is the proton is called **positive electricity**. If a substance has on its surface more protons than electrons it is said to be charged with positive electricity. The quantity of an electric charge may be measured, the practical unit being the coulomb. The term **static electricity** applies properly to the electricity of stationary charges, however produced; the term **dynamical electricity**, to moving charges, which give rise to the phenomena of the electric current, whether generated by friction, by induction, by means of a voltaic battery or dynamo, or in any other way.
